

THE FUTURE OF CITIES // A GLIMPSE INTO URBAN TECHNOLOGIES

Woven City

A vision-language AI model, run as city
infrastructure

Ash Mohaghegh — Lightning Talk #2

WHAT IS IT AND HOW DOES IT WORK?

WHERE WE ARE NOW

One year in, a small live test bed is scaling up

~30

proofs of concept running with residents

160

residents taking part, from roughly 80 households

31

partner companies building and testing on site

11

homes with household robots, 1,000+ tasks tested

BY END OF 2026

Vision Engine 2.0 reasons about why an event happened

FISCAL 2026

Safety system tested off site on Shizuoka government vehicles

NOVEMBER 2028

Phase 2 complete for about 600 more residents

The open question is whether it transfers to real cities

THE PROMISE

AI as shared infrastructure

One model already serves road safety and a partner trial, and Toyota plans to deploy it beyond the site.

THE LIMIT

A lab, not yet a city

About 160 residents on a corporate site, and most applications are still proofs of concept.

THE TRADE-OFF

Safety through constant sensing

The system depends on continuous cameras. Critics say residents become permanent research subjects.

Thank

You!

Q: Do you think incorporating AI/ML-based technologies into cities widens socioeconomic disparities OR does it resolve these underlying issues? Does the potential of incorporating such technologies outweigh the negative implications that could manifest?
